# Mechanical properties of bio-based foam

COST FP1 303 Technical Workshop

24.02.2016

Madrid

► Institute for Materials and Wood Technologies

# Why panel weight reduction?

## Customers point of view

- ▶ Design trend
- ▶ Transportation cost
- ▶ Ease of handling
- ▶ Ease of assembly

## Application fields

- ▶ Furniture
- ▶ Interior paneling
- ▶ Packaging

# Why a continuous process ?

- ▶ Cost-efficient production
- ▶ Mechanical interlocking connection between layers, no adhesive needed

# Challenges

## Previous work

- ▶ EPS as core material, with pentane as blowing agent
- ▶ Alternative: Expancel<sup>®</sup> microspheres

*at University of Hamburg (J. Luedtke, J. Welling, A. Shalbafan, H. Thoemen)*

## Materials requirement

- ▶ Application as a dry powder or granulate
- ▶ Nonflammable/non-VOC foaming agent
- ▶ Bio-based, preferably biodegradable
- ▶ Overlapping processing window

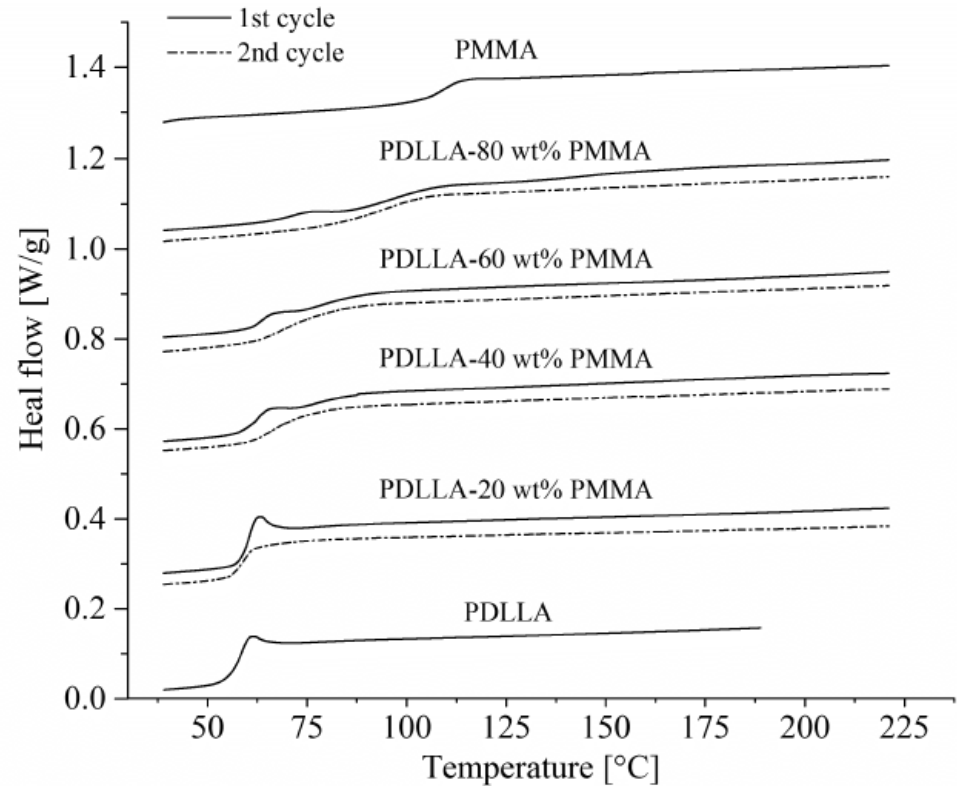

# Choice of the foam material

- ▶ poly(D,L-lactide) (PLA) blended with PMMA (50/50wt%) + talc as nucleating agent
- ▶ Impregnation with liquid  $\text{CO}_2$  as blowing agent

- ▶ Solide foam precursors (granulates), stable at room T
- ▶ Foam and coalesce at  $80^\circ\text{C} - 90^\circ\text{C}$

# Foam core layer

## Goal of the study

- ▶ Mechanical characterization and comparison of the various foam types
- ▶ Investigation of the influence of the processing conditions

## Methods

- ▶ Production of ULPB with various foam core layer (target density :  $100 \text{ kg/m}^3$ )
  - ▶ EPS
  - ▶ Microsphere
  - ▶ PLA/PMMA
- ▶ Production of reference molded PLA/PMMA
- ▶ Extraction of specimens
- ▶ Mechanical testing

# Materials

| Property                     | MS               | EPS          | PLA-PMMA        |
|------------------------------|------------------|--------------|-----------------|
| Particle size                | 15 $\mu\text{m}$ | 0.3 – 0.8 mm | 2 – 2.5 mm      |
| Particle shape               | Spherical        | Spherical    | Cylinder        |
| Blowing agent                | Isobutane        | Pentane      | CO <sub>2</sub> |
| Glass transition temperature | 80°C             | 103°C        | 75°C            |

- ▶ Solid foam precursors
- ▶ Resinated Wood particles

# Experimental methods

Shear

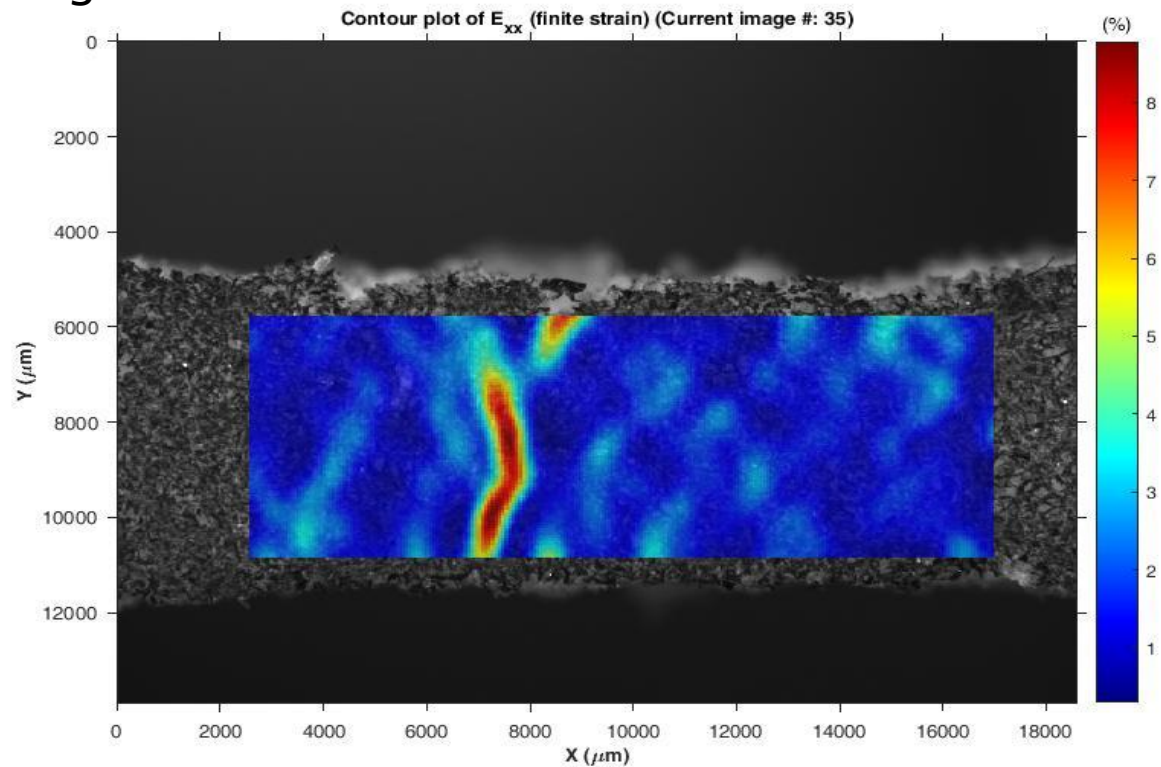

Tension - Compression

# Evaluation of the results

- ▶ Digital image correlation
- ▶ Strain field computing
- ▶ Strain-stress curve drawing
- ▶ Elastic properties computing

# Results

## Foam materials comparison

Pre- and post-yield behavior can be easily observed

# Results

## Material comparison

- ▶ Strong influence of the microstructure (cell density, ...)

# Results

## Microscopy

- ▶ For PLA-PMMA, the fracture occurs in-between precursors

# Results

## PLA in ULPB and reference PLA

- ▶ Better coalescence leads to better properties
- ▶ Process condition are crucial

# Conclusion and Futur work

- ▶ PLA based polymer can be used as solid foam precursor when impregnated with liquid CO<sub>2</sub>
- ▶ Bio based foam has similar properties as the standards oil based foams
  
- ▶ Better understanding and control of the production process
  - ▶ The foamability of the precursors
  - ▶ Investigate the influence of the environmental conditions (T, RH)
  - ▶ Improve the interface
- ▶ Use of a 100% bio based foam core layer
  - ▶ Precursor particles with embedded wood fibres
  - ▶ Precursor particles with embedded cellulose nanofibrils

Thank you
