**4-5 March 2015,  
COST FP1303 Meeting, Tallinn, Estonia.**

# Background

- Wood-plastic (WPC) composites
  - Prone to decay fungi and wood destroying insects if wood content not protected
  - Without preservative chemical durability only relies on encapsulation properties of plastic matrix

Decay activity

Termite activity

# Results

## Zinc borate

- Incorporated during WPC manufacturing
- Only 1% of weight (wood component) was added
- Environmentally friendly and durable WPC were produced

## Mass loss reductions based on lab tests:

Activity	Reduction (%)
Termite ( <i>C. formosanus</i> )	80 ↓
Decay ( <i>F. palustris</i> )	73 ↓
Decay ( <i>T. versicolor</i> )	55-65 ↓
